Slot : B

Project Title: AI-Based Food Donation and Redistribution Platform Using NLP

Module Photographs:

Project Description:

I contributed significantly to the design and development of the AI-Based Food Donation and Redistribution Platform by focusing on Module 1: Natural Language Food Information Extraction. My contribution included designing the workflow for identifying information such as food type, quantity, location, availability time, and food condition.

In addition, I was actively involved in implementing NLP-based processing techniques such as text preprocessing, tokenization, keyword extraction, and Named Entity Recognition (NER) to convert unstructured food descriptions into structured information. I also contributed to improving the accuracy and efficiency of the information extraction process and ensured that the extracted data could be smoothly passed to the subsequent food classification and semantic donor–receiver matching modules
